

# [METHOD OF COMMUNICATION USING AUDIO/VIDEO DATA]

## Abstract

A method of transmitting and receiving an audio/video data, and a method of communication between a first mobile communication apparatus and a second mobile communication apparatus using audio/video data are provided. An audio/video data to be transmitted is selected via the first mobile communication apparatus. Next, the audio/video data is transformed into at least one data packet via the first mobile communication apparatus based on a permitted data flow specified by PHS. Next, the packet data is transmitted via the first communication apparatus. Thereafter, the data packet is received via the second mobile communication apparatus where the data packet is transformed into the audio/video data.
